

EXP.NO: 8

AIM:

To develop a Job Portal web application that validates user inputs using JavaScript on the client side and stores job/project details (title, description, date, category) in a database using Servlet/JSP.

ALGORITHM:

1. Start the application.
 2. Display the Job Entry Form (Add Job/Project).
 3. Accept user inputs such as title, description, date, and category.
 4. Perform client-side validation using JavaScript:
 - Check for empty fields.
 - Validate title (minimum length).
 - Validate date (must not be empty).
 5. If validation fails:
 - Show error messages.
 - Prevent form submission.
 6. If validation is successful:
 - Submit form to Servlet.
 7. On server side:
 - Receive form data.
 - Connect to database.
 8. Store job/project details in database.
 9. Display all entries using JSP.
 10. Stop the application.
-

STEPS:

1. Design job/project form (Title, Description, Date, Category).
2. Add JavaScript validation.
3. Configure Servlet for form submission.
4. Connect MySQL database using JDBC.

5. Create table for storing entries.
 6. Insert validated data into database.
 7. Retrieve and display all entries.
 8. Show confirmation to user.
 9. Handle errors properly.
 10. Test application.
-

ASSUMPTIONS (BUSINESS LOGIC):

1. Title must be at least 3 characters.
 2. Description cannot be empty.
 3. Date must be selected.
 4. Category must be selected.
 5. All fields are mandatory.
 6. Data must be validated both client-side and server-side.
 7. Database stores all job/project details securely.
 8. Duplicate entries are allowed.
 9. Proper error messages are shown.
 10. User can view all added entries.
-

PROGRAM

AddJob.html

```
<!DOCTYPE html>
<html>
<head>
<title>Add Job / Project</title>
<script src="validate.js"></script>
<style>
body{
    font-family: Arial;
    background: #dbe2ef;
    text-align: center;
```

```

}
.card {
    width: 600px;
    margin: 50px auto;
    background: white;
    padding: 25px;
    border-radius: 10px;
}
input, textarea, select {
    width: 100%;
    padding: 10px;
    margin: 10px 0;
}
button {
    background: green;
    color: white;
    padding: 10px;
    border: none;
    width: 100%;
}
</style>
</head>
<body>

<div class="card">
<h2>Add Job / Project</h2>

<form action="AddJobServlet" method="post" onsubmit="return validateForm()">

<input type="text" name="title" placeholder="Job/Project Title">
<textarea name="description" placeholder="Description"></textarea>
<input type="date" name="date">

<select name="category">
<option value="">Select Category</option>
<option>Web Development</option>
<option>Machine Learning</option>
<option>App Development</option>
</select>

<button type="submit">Add Entry</button>

```

```
</form>
```

```
</div>
```

```
</body>
```

```
</html>
```

validate.js

```
function validateForm() {
```

```
    let title = document.forms[0]["title"].value;
```

```
    let desc = document.forms[0]["description"].value;
```

```
    let date = document.forms[0]["date"].value;
```

```
    let category = document.forms[0]["category"].value;
```

```
    if (title.length < 3) {
```

```
        alert("Title must be at least 3 characters");
```

```
        return false;
```

```
    }
```

```
    if (desc.trim() === "") {
```

```
        alert("Description cannot be empty");
```

```
        return false;
```

```
    }
```

```
    if (date === "") {
```

```
        alert("Select a date");
```

```
        return false;
```

```
    }
```

```
    if (category === "") {
```

```
        alert("Select a category");
```

```
        return false;
```

```
    }
```

```
    return true;
```

```
}
```

AddJobServlet.java

```

<th>Date</th>  
<th>Category</th>  
</tr>  
  
<%  
try {  
  
    Class.forName("com.mysql.cj.jdbc.Driver");  
  
    Connection con = DriverManager.getConnection(  
        "jdbc:mysql://localhost:3306/jobportal_db", "root", "root"  
    );  
  
    Statement st = con.createStatement();  
    ResultSet rs = st.executeQuery("SELECT * FROM jobs");
```

```
while(rs.next()) {
    %>

    <tr>
    <td><%= rs.getString("title") %></td>
    <td><%= rs.getString("description") %></td>
    <td><%= rs.getString("date") %></td>
    <td><%= rs.getString("category") %></td>
    </tr>

    <%
    }

    con.close();

    } catch(Exception e) {
    out.println(e);
    }
    %>

</table>

</body>
</html>
```

OUTPUT:

OUTPUT:

RESULT:

The Job Portal application successfully validates user inputs using JavaScript and stores validated data in a database using Servlet/JSP, ensuring proper data handling and display.
